-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

## Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

## Status

- 1) ☒ Responsive to communication(s) filed on RCE (12 Apr 04)/Amendment (03 Mar 04).
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

## Disposition of Claims

- 4) ☒ Claim(s) 11-21 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 11-21 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

## Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

## Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_.
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: \_\_\_\_\_.

Art Unit: 2614

### DETAILED ACTION

#### *Continued Examination Under 37 CFR 1.114*

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 12 April 2004 (RCE) and amendment (03 March 2004) has been entered.

2. Applicant's arguments filed 03 March 2004 have been fully considered but they are not persuasive.

#### *Claim Rejections - 35 USC § 103*

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 11-21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kunzman et al., US 6,054,832 832 in view of Hewlett et al, US 5,812,303 and applicant's admitted prior art.

In considering claims 11-12 and 15;

Art Unit: 2614

- a) the claimed light source...* is met by lamp 14 (Fig 1)
- b) the claimed light-transmitting filters...* is met by color wheel 18 which includes a respective blue, red, green and clear (white) (50, 54) color segments (Fig 4)
- c) the claimed light valve...* is met by spatial light modulator 28 (Fig 1)
- e) the claimed a signal converter portion to control said white light-transmitting filter using a control signal* is met by timing and electronics 24 which gives operating instructions and communicates with sensor board 22 and motor 20 (Fig 1, col 3, line 23-33).

However, Kunzman remains silent on which filter (white, non-white) is used in displaying information corresponding to the higher-order and lower-order bits of digital data (e,f).

Thus the integrated value of the transmittivity of the white (clear) filters is less/smaller than the values of the blue, green and red filters, as can be illustrated by color wheel 18 where the clear segments only account for a fractional portion of the entire color wheel (Fig 4).

Kunzman does disclose a color wheel 18 which includes clear filter segments (50,54) which are used to increase the color efficiencies (col 2, line 15-35) and to control the brightness for all areas of the image, making dark areas appear correctly, while not washing out the bright areas (col 3, line 11-21), where the clear (white) filters are used to properly transmit the correct colors at the proper timing, where the clear segment is used to transition properly between segments (col 4, line 38-44). Kunzman also discloses a color wheel 18 which includes a blue, green and red segment (Fig 4).

The examiner incorporates, Hewlett et al., US 5,812, 303 which discloses the use of NDF (neutral density filter) for each color (RGB), where the NDF filter is used in conjunction with the respective color (RGB) segment. The NDF segment is used to display the lower order bit thereby increasing the minimum amount of time for display of the lower significance bits (col 2, line 9-14) while displaying the most significant bits with the RGB filters, which allows more bits per sample in the display images and produces images with fewer artifacts and images that more closely match that of conventional display systems (col 2, line 9-18).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify, Kunzman which discloses an electronically programmable color wheel which includes clear filter segments to control the brightness of all areas of the image and to properly transmit the correct colors at the proper time, with Hewlett, by incorporating neutral density filters into the color wheel, to display an image with fewer artifacts, and increasing the number of bits available for display.

However, the combination of Kunzman and Hewlett does not specifically disclose/discuss a value which is obtained by integrating the value of a transmissivity in a visible range of the white-filter being smaller than the combined integrated values of the non-white filters.

Kunzman does disclose a color wheel where the clear segments (50,54) only occupy a small fraction of the entire color wheel. Thus the non-clear segments occupy

Art Unit: 2614

the majority of color wheel 18 and would provide an integrated value of transmissivity larger than the non-clear segments if computed.

Hewlett discloses a color wheel which utilizes neutral density filters (clear segments) which discloses the use of NDF (neutral density filter) for each color (RGB), where the NDF filter is used in conjunction with the respective color (RGB) segment.

Also, as disclosed by applicant's admitted prior art, Fig 2, a color wheel with filter segments Crd, Cgd, Cbd of lower transitivity to increase the grey scale of the image data, where the filter segments Crd, Cgd and Cbd have a transmissiivity of  $1/8$  their respective filters Cr, Cg and Cb. The filter segments Crd, Cgd, and Cbd, are used to increase the grey scale (brightness) of the displayed image.

Therefore, it would have been obvious to one skilled in the art at the time of the invention to modify Kunzman and Hewlett, which discloses a display system which utilizes clear/white segments in a color-wheel to increase the efficiency and brightness of a displayed image, with applicant's admitted prior art, which would produce a value (as claimed) where the value of the clear (white) filter is less than the non-clear (white) filters (R,G,B), since the clear filter segments are used to enhance the color/brightness of a displayed color image (not a black-white image).

In considering claims 13 and 17,

*The claimed wherein if brightness required by the input data...is met by Kunzman*

Art Unit: 2614

Which utilizes the clear (white) segments of the color wheel 18 to adjust the dark states/areas of the image and the brightness state/area of the image (col 3, line 11-22, line 59-67 to col 4, line 1-9).

In considering claim 14,

Kunzman does not specifically disclose a spatial light modulator that reflects, Kunzman discloses a spatial light modulator (light valve) which is used to (transmit) the display received image data onto a display.

The use of a spatial light modulator such as a digital micro-mirror device (DMD) is a well-known type of modulator which transmits/reflects image data by either being in the on/off state, which increase the overall efficiency of the display system, by decreasing dead/lag times between color-changes.

As disclosed by applicant Fig 2, Page 2, line 20, the use of a DMD device is a conventional light valve which is used to display image data, where the DMD device is either in an Off or On state.

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify Kunzman, which discloses an electronically programmable color wheel to increase the efficiency of the displayed image, by eliminating transitions between colors and increasing brightness, with a conventional light valve's such as a DMD which is used to increase the efficiency of a displayed image.

In considering claim 16,

Art Unit: 2614

Kunzman does not specifically disclose/discuss a value which is obtained by integrating the product of spectral transmission factor of the white light filters and the spectral luminous efficiency with respect to wavelength being less than the sum of values of the non-white filters in the calculation.

However, as disclosed by applicant's admitted prior art, Fig 2, a color wheel with filter segments Crd, Cgd, Cbd of lower transmissivity to increase the grey scale of the image data, where the filter segments Crd, Cgd and Cbd have a transitivity of 1/8 their respective filters Cr, Cg and Cb. The filter segments Crd, Cgd, and Cbd, are used to increase the grey scale (brightness) of the displayed image.

Therefore, it would have been obvious to one skilled in the art at the time of the invention to modify Kunzman, which discloses a display system which utilizes clear/white segments in a color-wheel to increase the efficiency and brightness of a displayed image, with applicant's admitted prior art, which would produce a value (as claimed) where the value of the clear (white) filter is less than the non-clear (white) filters (R,G,B), since the clear filter segments are used to enhance the color/brightness of a displayed color image (not a black-white image).

In considering claims 18-19,

*a) the claimed decomposing light from a light source into a plurality of colors, one of plurality of colors being white* is met where the light from light source 14 is decomposed into a plurality of colors via color 18 (Fig 1) where the color wheel includes a clear segment (50, 54) for decomposing the light into the white color

Art Unit: 2614

*b) the claimed controlling a white-light transmitting filter of a set of filters with a control signal* is met by timing and electronics 24 which gives operating instructions and communicates with sensor board 22 and motor 20 (Fig 1, col 3, line 23-33).

*c) the claimed displaying information* is met where the image created by the array of individual elements on the array is displayed (col 3, line 46-48)

*d) the claimed projecting said plurality of colors from said set of filters* is met by projection optics 30 (Fig 1).

*e) the claimed an integrated value of a transmittivity in a visible range of said-white transmitting filter is smaller than integrated values of transmissivities in a visible range of said non-white transmitting filters* is met where the color wheel 18 of Kunzman includes clear segments (50,54) which are used to increase the color efficiencies and used to increase the brightness of the image, where the clear segment is also used to transition properly between segments. Thus the integrated value of the transmittivity of the white (clear) filters is less/smaller than the values of the blue, green and red filters, as can be illustrated by color wheel 18 where the clear segments only account for a fractional portion of the entire color wheel (Fig 4).

However, Kunzman remains silent on displaying information corresponding to the higher-order and lower-order bits of digital data (b,c)). Kunzman does disclose a color wheel 18 which includes clear filter segments (50,54) which are used to increase the color efficiencies (col 2, line 15-35) and to control the brightness for all areas of the image, making dark areas appear correctly, while not washing out the bright areas (col

Art Unit: 2614

3, line 11-21), where the clear (white) filters are used to properly transmit the correct colors at the proper timing, where the clear segment is used to transition properly between segments (col 4, line 38-44). Kunzman also discloses a color wheel 18 which includes a blue, green and red segment (Fig 4).

The examiner incorporates, Hewlett et al., US 5,812, 303 which discloses the use of NDF (neutral density filter) for each color (RGB), where the NDF filter is used in conjunction with the respective color (RGB) segment. The NDF segment is used to display the lower order bit thereby increasing the minimum amount of time for display of the lower significance bits (col 2, line 9-14) while displaying the most significant bits with the RGB filters, which allows more bits per sample in the display images and produces images with fewer artifacts and images that more closely match that of conventional display systems (col 2, line 9-18).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify, Kunzman which discloses an electronically programmable color wheel which includes clear filter segments to control the brightness of all areas of the image and to properly transmit the correct colors at the proper time, with Hewlett, by incorporating neutral density filters into the color wheel, to display an image with fewer artifacts, and increasing the number of bits available for display.

However, the combination of Kunzman and Hewlett does not specifically disclose/discuss a value which is obtained by integrating the value of a transmissivity in a visible range of the white-filter being smaller than the integrated values of the non-white filters.

Art Unit: 2614

Kunzman does disclose a color wheel where the clear segments (50,54) only occupy a small fraction of the entire color wheel. Thus the non-clear segments occupy the majority of color wheel 18 and would provide an integrated value of transmissivity larger than the non-clear segments if computed.

Hewlett discloses a color wheel which utilizes neutral density filters (clear segments) which discloses the use of NDF (neutral density filter) for each color (RGB), where the NDF filter is used in conjunction with the respective color (RGB) segment.

Also, as disclosed by applicant's admitted prior art, Fig 2, a color wheel with filter segments Crd, Cgd, Cbd of lower transitivity to increase the grey scale of the image data, where the filter segments Crd, Cgd and Cbd have a transitivity of 1/8 their respective filters Cr, Cg and Cb. The filter segments Crd, Cgd, and Cbd, are used to increase the grey scale (brightness) of the displayed image.

Therefore, it would have been obvious to one skilled in the art at the time of the invention to modify Kunzman and Hewlett, which discloses a display system which utilizes clear/white segments in a color-wheel to increase the efficiency and brightness of a displayed image, with applicant's admitted prior art, which would produce a value (as claimed) where the value of the clear (white) filter is less than the combined non-clear (white) filters (R,G,B), since the clear filter segments are used to enhance the color/brightness of a displayed color image (not a black-white image).

In considering claims 20-21,

As stated above, with respect to independent claims 11 and 18, Kunzman does not explicitly disclose the use of higher-order, lower-order bits in the system.

Kunzman does disclose a color wheel 18 which includes clear filter segments (50,54) which are used to increase the color efficiencies (col 2, line 15-35) and to control the brightness for all areas of the image, making dark areas appear correctly, while not washing out the bright areas (col 3, line 11-21), where the clear (white) filters are used to properly transmit the correct colors at the proper timing, where the clear segment is used to transition properly between segments (col 4, line 38-44). Kunzman also discloses a color wheel 18 which includes a blue, green and red segment (Fig 4).

Kunzman also discloses that the segments on the color wheel are controlled by timing and electronics 24 which gives operating instructions and communicates with sensor board 22 and motor 20 (Fig 1, col 3, line 23-33).

The examiner incorporated, Hewlett et al., US 5,812, 303 which discloses the use of NDF (neutral density filter) for each color (RGB), where the NDF filter is used in conjunction with the respective color (RGB) segment. The NDF segment is used to display the lower order bit thereby increasing the minimum amount of time for display of the lower significance bits (col 2, line 9-14) while displaying the most significant bits with the RGB filters, which allows more bits per sample in the display images and produces images with fewer artifacts and images that more closely match that of conventional display systems (col 2, line 9-18).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify/utilize in Kunzman, the clear segment to display the

lower order bits and the RGB filters to display the higher order bits, where each filter segment is controlled respectively via timing and electronics 24 (thus being different control signals), to control the brightness of all areas of the image and to properly transmit the correct colors at the proper time, with Hewlett, by incorporating neutral density filters into the color wheel, to display an image with fewer artifacts, and increasing the number of bits available for display.

***Applicant's Arguments***

a) Applicant states that Kunzman discloses the color wheel has two clear regions that cover respectively 40 degrees and 20 degrees of the color wheel. The angle of the clear regions are selected in this manner to allow for the overall whitening purity or brightness of the entire display image to be maintained. Applicant states this is contrary to the present invention, since Kunzman teaches the use of the respective clear regions to increase the transmissivity or brightness of the white light in view of the non-white filters.

b) Applicant states that Hewlett teaches the use of a filter having a red, green and blue filter region. Hewlett does not teach or suggest the use of white transmitting filters, thus cannot teach or suggest a transmissivity in a visible range...of non-white transmitting filters.

c) Applicant states that applicants admitted prior art also fails to teach the use of white transmitting filters.

***Examiner's Response***

- a) The examiner disagrees. Although, Kunzman discloses the clear regions are used to increase the transmissivity or brightness of the white light in view of the non-white filters, the image data projected utilizing the red, green and blue filter segments would still occupy a larger integrated value of transmissivity if computed. The white light/clear segments are used as enhancements to the main colors (red, green and blue) filter segments.
- b) The examiner agrees that Hewlett discloses the use of filter that includes a red, green and blue filter region. However, Hewlett does not disclose/suggest that the system cannot use white filters, on the contrary Hewlett would be motivated by Kunzman to utilize white filters to enhance the color/brightness of the display of the non-white filters.
- c) The examiner agrees, however the addition of white/clear segments on the color wheel such as applicant's admitted prior art (Fig 2) would not render Fig 2 inoperable, since the white/clear segments could be added to increase the brightness of the display of the non-white filter segments.

***Conclusion***

4. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Brian Yenke whose telephone number is (703) 305-9871. The examiner work schedule is Monday-Thursday, 0730-1830 hrs.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's Supervisor, John W. Miller, can be reached at (703)305-4795.

**Any response to this action should be mailed to:**

Commissioner of Patents and Trademarks

Washington, D.C. 20231

**or faxed to:**

**(703) 872-9314**

Hand-delivered responses should be brought to Crystal Park II, 2121 Crystal Drive, Arlington, VA, Sixth Floor (Receptionist). Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Technology Center 2600 Customer Service Office whose telephone number is (703)305-HELP.

General information about patents, trademarks, products and services offered by the United States Patent and Trademark Office (USPTO), and other related information is available by contacting the USPTO's General Information Services Division at:

800-PTO-9199 or 703-308-HELP

(FAX) 703-305-7786

(TDD) 703-305-7785

An automated message system is available 7 days a week, 24 hours a day providing informational responses to frequently asked questions and the ability to order certain documents. Customer service representatives are

available to answer questions, send materials or connect customers with other offices of the USPTO from 8:30 a.m. - 8:00p.m. EST/EDT, Monday-Friday excluding federal holidays.

For other technical patent information needs, the Patent Assistance Center can be reached through customer service representatives at the above numbers, Monday through Friday (except federal holidays) from 8:30 a.m. to 5:00 p.m. EST/EDT.

General information brochures can also be obtained in person from the Patent Search Room located in Crystal Plaza 3, Room 1A03, 2021 South Clark Place, Arlington, VA 22202.

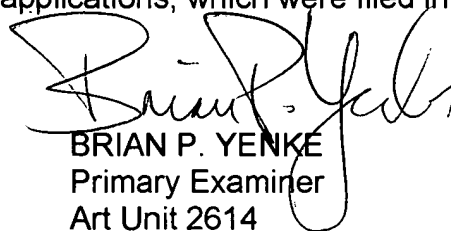

The Patent Electronic Business Center (EBC) allows USPTO customers to retrieve data, check the status of pending actions, and submit information and applications. The tools currently available in the Patent EBC are Patent Application Information Retrieval (PAIR) and the Electronic Filing System (EFS). PAIR (<http://pair.uspto.gov>) provides customers direct secure access to their own patent application status information, as well as to general patent information publicly available. EFS allows customers to electronically file patent application documents securely via the Internet. EFS is a system for submitting new utility patent applications and pre-grant publication submissions in electronic publication-ready form. EFS includes software to help customers prepare submissions in extensible Markup Language (XML) format and to assemble the various parts of the application as an electronic submission package. EFS

Art Unit: 2614

also allows the submission of Computer Readable Format (CRF) sequence

listings for pending biotechnology patent applications, which were filed in paper form.
